Puzzle Completion & YarnSpinner Connection: 3/25/26

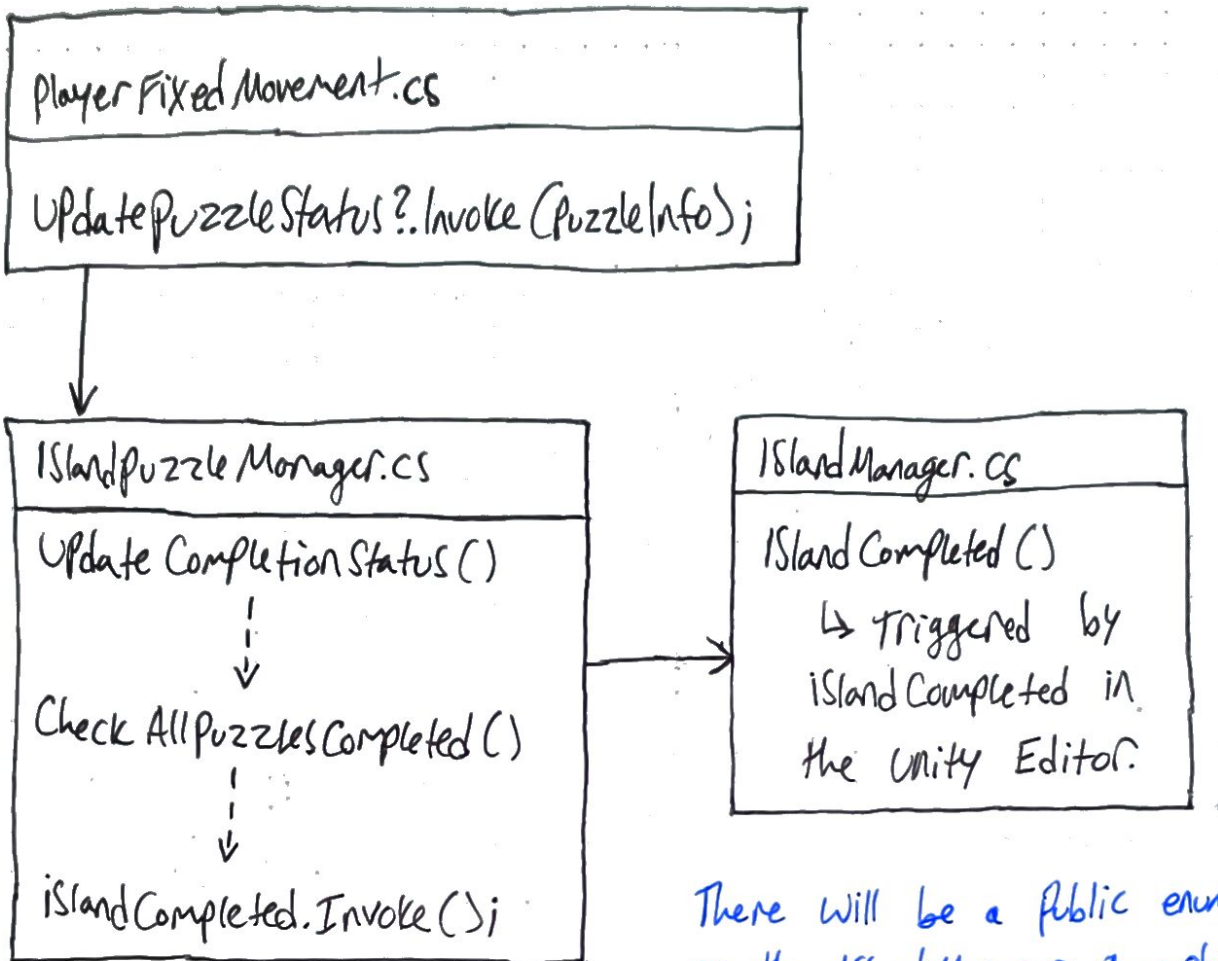
- When the Player reaches the end tile, we fire off 2 events: PuzzleCompleted (in the editor) and UpdatePuzzleStatus (just straight C#).

- UpdatePuzzleStatus is picked up by IslandPuzzleManager.cs & the PuzzleInfo is passed into UpdateCompletionStatus().
- At the end of that method, we always call CheckAllPuzzlesCompleted() to see if all puzzles are done.
- If they are, we currently just print out a confirmation message.

- There needs to be a linkage set up between all puzzles being completed and the actual IslandManager.cs script.

- Then, IslandManager.cs must somehow update the ice island variables in the YarnSpinner memory.

- In CompletionButton.cs is a public Reference to the IMemoryVariableStorage named VariableStorage which I can probably do the same.



The InMemoryVariableStorage datatype belongs to the Script of the Same name that's attached to the Dialogue System prefab object.

There will be a public enum on the IslandManager gameObject that can be adjusted in each Scene & will be passed into IslandCompleted() automatically when it's triggered. This ensures <u>Safe</u> handling of data that informs the code what island we're currently on. I say "Safe" because it's better than manually typing the Island name.
