Depth of Field Post-Processing Notes: 3/31/26

- The GameStateManager notifies many subscribers of changes, including the view Manager, which I believe is the most relevant Manager for influencing post-processing effects.

GameStateManager.cs

- Sets the game state and informs the ViewManager.cs.

→

ViewManager.cs

- Determines what camera and UI to switch to.
- HandlePostProcessor() determines if the volume or post processor should be enabled/disabled.

→

PostProcessingManager.cs

- Contains a method named PostProcessingManager.cs that should toggle the game object or volume comp.
- Subscribed to the toggle PostProcessor event from viewManager.cs.
