Notes on Sampling other projects & ideas: 3/30/26

- In the More Mountains > Loft3D.unity Scene, they have the 3D Cameras Prefab Object, which has a child object named "Post Processing"

- The Post Processing object also has another component named "Post Processing Volume," which appears to contain that blur effect around the edges of the camera.
    - I can try to sample / take inspiration from this small camera effect for something like a fullscreen blur.

- I saw a video that said Post-Processing is built-in and ready to use if you have the universal render pipeline.
    - I installed Post-Processing Package version 3.5.4.
- In the Post-Process Volume component on the 'PostProcessing' object is the 'Profile' property.
    - Within that is the "LoftCameraProfile" asset.
- On the camera is the PostProcessLayer.cs script which contains 4 command buffers within the code.

PostProcessing (GameObject)

- Post-Process Volume (Comp.)
  - IS Global ☑
  - Weight: 1
  - Priority: 0
  - Profile (Instance): LoftCameraProfile

Tag: Untagged
Layer: Default

Main Camera (GameObject)

- Camera (Comp.)
  - There's a lot of default properties.
  - Also 4 "Command buffers"
    - "Before Lighting"
    - "BeforeImageEffectsOpaque"
    - "BeforeImageEffects"] Post-processing
    - "Before Reflections"
  - Post-Process Layer (Comp.)
    - Trigger: MainCamera
    - Layer: Everything
    - Mode: Fast Approximate
    - Other properties as well...

Tag: MainCamera
Layer: Player

Both of these GameObjects are child objects of the "3D Cameras" prefab.
