Issue #254 Notes: 3/25/26

- The out-of-bounds/range error is occuring in relation to the IsCellEmpty() method in GridManager.cs.
  - This method takes in an int 'x' and int 'z'.
  - It's also being called by a few different methods.
- Ok, it looks like the issue has something to do with the changes that Dan made when adding together the destination coordinates and the current coordinates.
- It used to be this:

```
if (gridManager.IsCellEmpty(newX, newZ)
```

- And now it became this for better ice tile handling:

```
if (gridManager.IsCellEmpty(destinationX + PlayerGridX,
                            destinationZ + PlayerGridZ)
```

- This is ultimately what's causing the out-of-bounds error. However, Dan said he added it as an attempt to fix the bug in which the player was moving to empty coordinates.

- Dan noted above the destination x/z declarations that these variables keep track of the potential tile for the player to move to (specifically for ice tiles in this scenario).
- They both start at 0, but are appended to by the values of delta x & delta z in TryToMovePlayer().
- Right before that, the delta coords are set to be the values of the 'xDir' and 'zDir' parameters.
