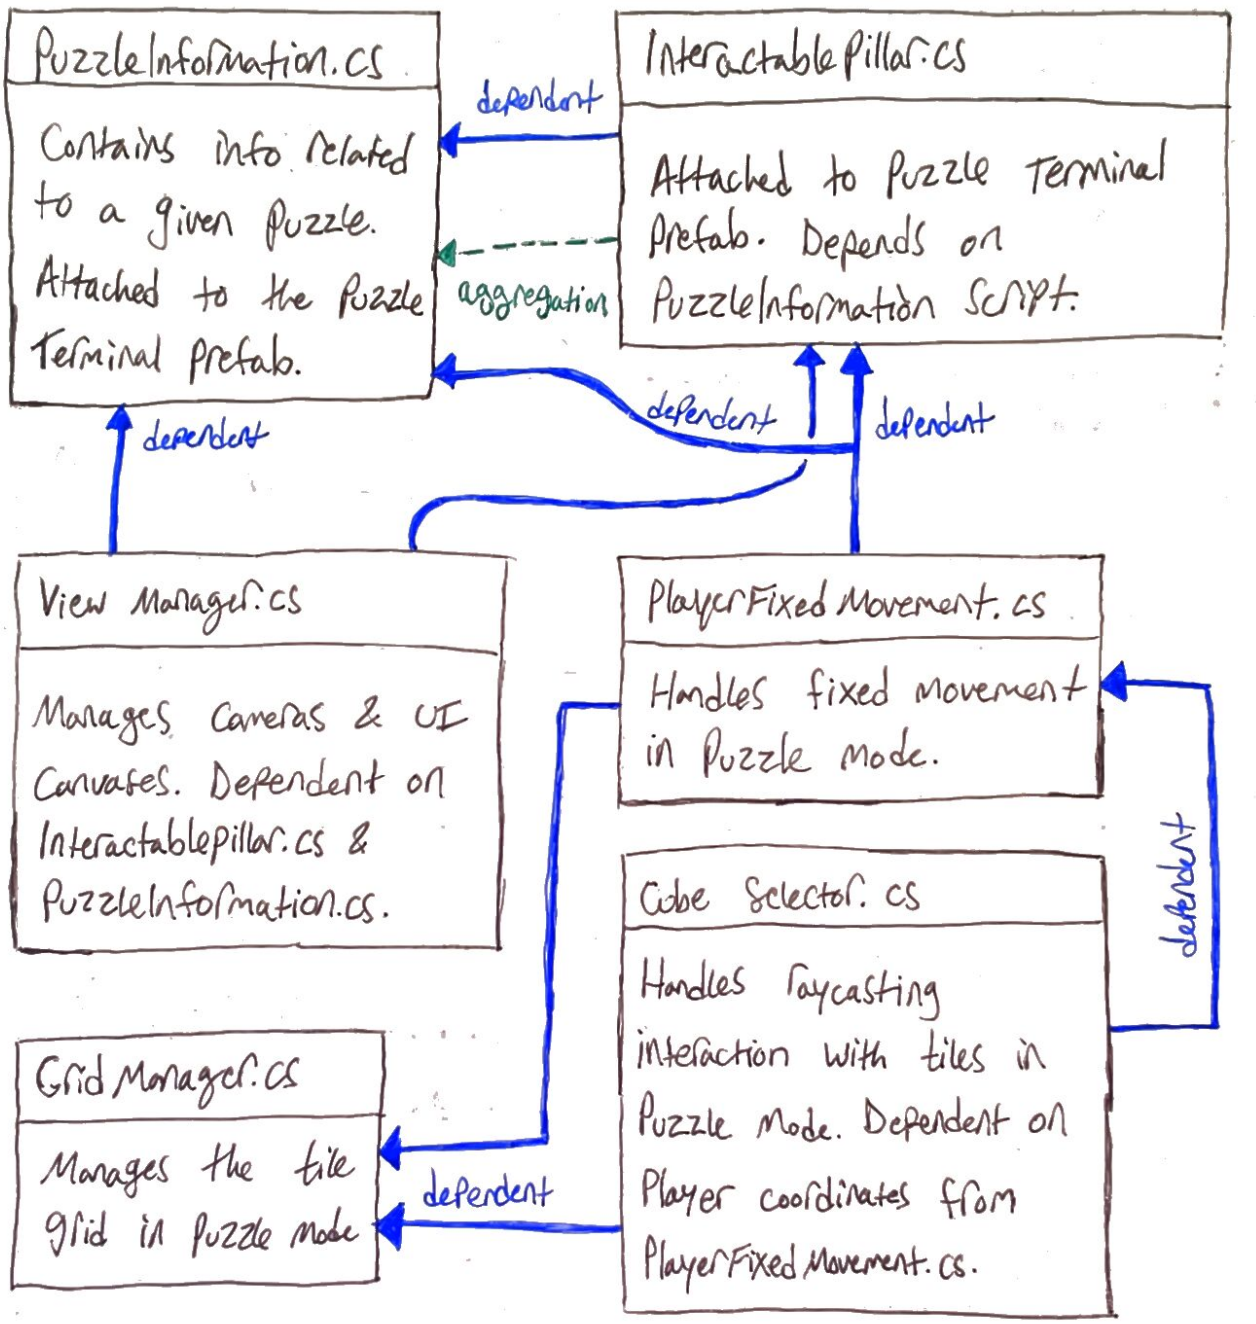
Notes on Puzzle System Interaction & Functionality Relationships

3/6/26



← Puzzle Terminal

Player Interacts ("E") with the terminal, which is currently set to notify the GameStateManager.

What kind of PuzzleInformation are we trying to send? We need grid info (Possibly?), like the Start & end tiles, we need the puzzle Camera & Canvas.

The camera & UI elements are handled and assigned in ViewManager.cs.

The specific UI and camera is assigned through a Switch-Case Statement comparing the new gamestate.

Perhaps the camera can be assigned during/before we reach the assignment point of "target camera"

The cameras & UIs are all initialized in Awake(). Perhaps another method to update these values can be added into ViewManager.cs before triggering the Game State Switch & firing off "transitionedTONewState."

InteractablePillar.cs

- Invokes PuzzleTriggered event with PuzzleInfo Script.

ViewManager.cs

- Receives "PuzzleTriggered".
- Sets puzzle camera & UI accordingly.

PlayerFixedMovement.cs

- Receives "PuzzleTriggered"
- Sets StartTile & endTile.
- Should prob. get the other scripts that are attached to the puzzle camera.

on the puzzle camera:

- CubeSelector.cs
- ClickRayTest.cs
- PhysicsRaycaster
