Lighting in Ice Island Notes: 3/29/26

- The dynamic tile texturing system was kind of created on a whim for the vertical slice.
- However, I noticed that, from the overhead view of the Puzzle Camera, the Normal Tiles appear like blank white slates.
- I did some messing around and realized it was due to the directional light in the scene.
- There are 4 different types on a light component:
  - Spot
  - Directional ← current setting
  - Point
  - Area (Baked only)
- Realtime lighting in games is, of course, calculated in real time at a higher performance cost, but is good for stuff like flashlights, moving objects, etc.
- That might be better for skye, but perhaps the tiles can use baked lighting for pre-calculated and consistent light maps.

- Although tiles <u>do</u> move, so perhaps they could benefit from realtime lighting.

- Also, the game does not take place indoors, which baked lighting is apparently better for.
