Notes on versioning for MacOS workflow: 3/30/26

- Trying to update the 'versioning' variable in the UnityActionsLFSMacOS.yml workflow.
- I tried changing it from 'None' to 'Semantic' but there was a build failure due to a "dirty branch"
- The error said that changes were made to the build profiles' MacOS.asset file during the build but those changes then were not committed.

- I ended up changing it from 'Semantic' to 'Tag' and this ran without errors. I'm now adding a step to print the version number in the build log.

- If this is correct, I'm going to see if I can use the output to dynamically name the build.
- ok, it printed out something blank.
- I will try it again the next time I create a new release so that the latest tag is linked to the absolute latest commit (no changes added to main since then).
