Notes regarding Addressable Assets building & Localization tables related to YarnSpinner: 2/25/26

- Inside of Assets > AddressableAssetsData > AssetGroups is a file named "Default Local Group.asset" which is included in the addressable assets build.

- Its build & load paths are both set to "Local"

- Both are set to build to windows:
  - Build Path: Library/com.unity.addressables/aa/windows/StandaloneWindows64
  - Load Path: {UnityEngine.AddressableAssets.Addressables.RuntimePath}/StandaloneWindows64

- This is different for all the localization tables, which have their Build & Load Paths set to "Custom".

- It also looks like there's .bundle files that get created everytime I attempt to rebuild the default build script in the addressable assets group window.
