To build to MacOS properly, I need to "code sign" the application, which it doesn't already have. This is probably why Sebasian got that Gatekeeper notification

The Unity docs say you must code sign your application to notarize it with XCode command line or Unity Build Automation.

Unity adds a Code Signature to every MacOS it produces which is known as a "Signing Identity."

To Notarize an application, Apple requires the code signature to include a cryptographic signature, such as a "Developer ID Certificate," which identifies the developer.

- Create a MacOS build profile
- Need to specify the architecture in PlayerSettings.SetArchitecture
- architecture must be associated with an integer:
  - 0 - None
  - 1 - ARM64
  - 2 - Universal
- I'll try universal (2) for now.

---

Added the target platform & also the architecture via the build profile file.

---

As I'm running the UnityActionsLFS macOS, I saw it debugged the message "unable to find image 'unityci/editor:ubuntu-6000.3.6f1-linux-il2cpp-3' locally," and then it pulls it from unityci/editor. It did the same with Mac
